Aligning the same equations
Omit equation numbering
Ugly alignment

Discussion

Working with equations

We define a set of equations as

$$a = b + c^2, \tag{1}$$

$$a - c^2 = b, (2)$$

$$left side = right side, (3)$$

$$left side + something \le right side, \tag{4}$$

for all something > 0.

Aligning the same equation

Aligning the equations by the equal sign gives a much better view into the placements of the separate equation components.

$$a = b + c^2, (5)$$

$$a - c^2 = b, (6)$$

$$left side = right side, (7)$$

$$left side + something \le right side,$$
 (8)

Omit equation numbering

Alternatively, the equation numbering can be omitted.

$$a=b+c^2,$$
 $a-c^2=b,$ left side = right side, left side + something \leq right side,

Ugly alignment

Some components do not look well, when aligned. Especially equations with different heights and spacing. For example,

$$E=mc^2, (9)$$

$$m = \frac{E}{c^2},\tag{10}$$

$$c = \sqrt{\frac{E}{m}} \tag{11}$$

Take that into account.

Discussion

This is where you'd normally give your audience a recap of your talk, where you could discuss e.g. the following

- ► Your main findings
- ► The consequences of your main findings
- ► Things to do
- ▶ Any other business not currently investigated, but related to your talk
